## **Step 1 — Insert Dragon Mounting Bolts**

 The four bolts shown fit into the two halves of the toolhead body. These will be the mounting bolts for the Dragon Hotend, later in this guide.

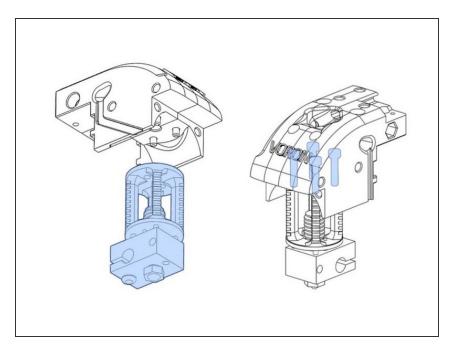

### Step 2 — Install Bowden Collet & Close Body

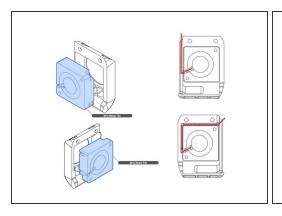

- Insert collet into one half of the body.
- Close the two body halves around the collet. Secure with nut and bolt, as shown.

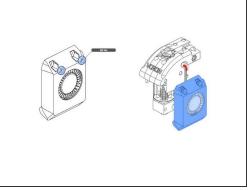

### Step 3 — Install Dragon Hotend

 Bolt in the Dragon Hotend with the previously installed screws. Orient the heater block as shown for proper fit.

#### Step 4 — Install Part Cooling Fans

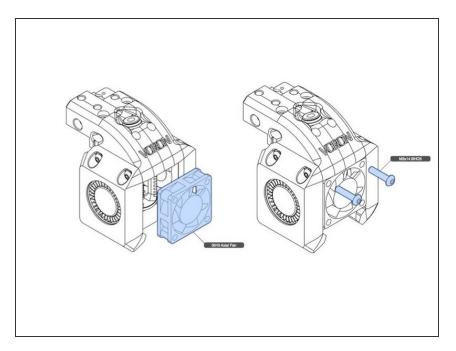

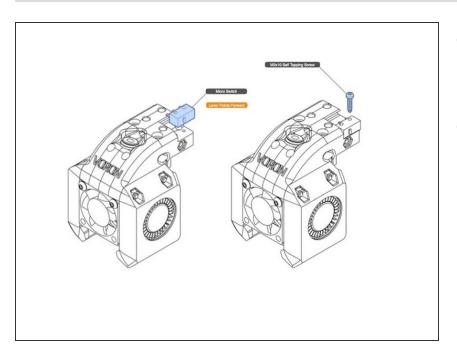

- Ensure that the fan shroud openings are clear and smooth. Since the parts are printed without supports, there may be strands of filament in the air path. Use a knife to clear and smooth the airways.
- Slide part cooling fans into their housings. Note the wire routing for each fan.
- Secure the fans with the long bolts with nuts, across the toolhead body.

# **Step 5** — **Install Dragon Heatsink Fan**

 Install hotend heatsink fan, as shown. The bolts screw into plastic. Avoid over tightening.

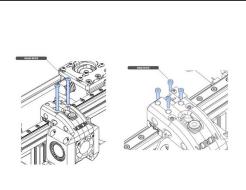

### Step 6 — Install X-Axis Endstop

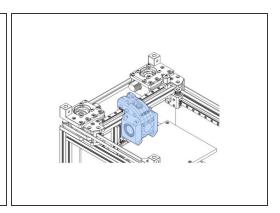

- Install the micro switch. Just one self-tapper screw is used, as shown.
- If your micro switch comes with a level over the switch, it should be removed.

# Step 7 — Install Toolhead on X-Axis

- The two long screws attach the toolhead to the belt retention block, and the four shorts screws to the linear rail cart.
- With those screws installed, Congratulations!, you have built and installed the Dragon toolhead.
